

Weekly meeting progress

Friday, Aug 7, 2026

What did I do this week?

- Improved the router reward function for better learning stability
- Refined the epsilon decay management to adjust the exploration schedule
- Started implementing the quantum version.
- Ran the project on CloudLab with the budget limit in ignore mode during training (10 GB database):
 - 2 experiments with a 5 GB index budget (50% of data size)
 - 2 experiments with a 2.5 GB index budget (25% of data size)

Benchmarked the classical version of the algorithm on a 10 GB TPC-H database with a 5 GB index budget, using budget mode ignore during training.

Total runtime in seconds:

	2	3	4	5	6
Exp 1			2164	1903	1558
Exp 2			1686	1959	1557
Mean			1925	1931	1557.5
DINA	3900	3700	3000	3500	3400

Benchmarked the classical version of the algorithm on a 10 GB TPC-H database with a 2.5 GB index budget, using budget mode ignore during training.

Total runtime in seconds:

	2	3	4	5	6
Exp 1		2777	2572	2441	2093
Exp 2			2061	2063	1222
Mean		2777	2316.5	2252	1657.5
5GB of indexes			1925	1931	1557.5

Next tasks

- Investigate ways to reduce training time
- Investigate why the project crashes when running with 2 or 3 replicas

X

- Run the project several times to gather results
- Continue implementing the quantum version?
